

Design for life

In the modern industrial market it has never been more important for projects to be designed with total design life criteria including the need for support framing, cable containment and pipework support bracketry installations to meet much longer system design life periods.

Galvanising is the most widely used form of corrosion resistance and is chosen because it offers a proven and cost effective solution for longevity of resistance to atmospheric corrosion.

Unistrut provides as standard both pre-galvanised and post-galvanised products as well as stainless steel for all its major product lines including; support channel, cable ladder, cable tray and cable basket, as well as a complete range of support accessories and fittings. All products are ideally suited for the harsh environments of today's industrial sectors, including infrastructure, energy and non-residential buildings.

Unistrut's engineering team has over 50 years of experience, so an early consultation with the company can help you select the ideal finish specification and best practice installation guidelines to help meet your application needs and save you time.

Supporting this is Unistrut's 10 year warranty on complete Unistrut metal framing solutions.

Neat and tidy

CableOrganizer.com is a retail website which specialises in cable and wire management products for both home and business. It stocks an extensive selection of braided sleeving, cable ties, wire loom and technician tool kits.

Convention centres and street fairs have cables running across floors, which if left uncovered certainly create a hazard to pedestrians. Floor cord covers create an easy walk over solution to the tangled cable jungle.

Network administrators and IT technicians can find just about everything needed for a new project – a server room simply could not function without racks, fans, patch panels and KVM switches. Patch cords and connections need to be neatly managed and clearly labeled. Within the LAN cabling and its routing system act as the lifeblood of the network, sending and receiving information.

CableOrganizer.com makes it easy to research products, make a list, then email or phone in a request for a quote.

Steely plan

Electrix International is a manufacturer of stainless steel cable management systems, specialising in trunking, conduit, cable tray, enclosures and strut.

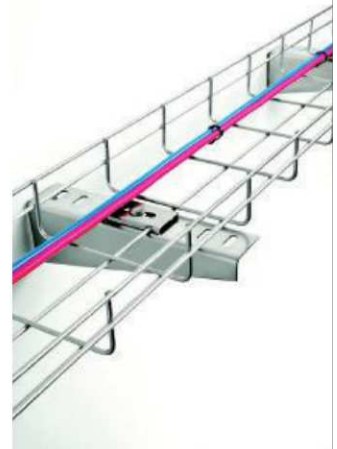

With over 300,000 products held in its UK headquarters, delivery of all standard ranges is fast and efficient.

Electrix's products are regularly used for network installations worldwide, especially in environments which require a product that can stand up to harsh conditions or for projects requiring a high level of hygiene.

Large quantities of Electrix's UL listed trunking systems are used by many of the leading names in the pharmaceutical industry, including GlaxoSmithKline and AstraZeneca, due to the ease with which you can clean the installation, thereby reducing contamination.

If a comprehensive range of standard products doesn't fully meet a customer's needs, Electrix can also offer a bespoke design service.
